CloudBerry Backup Functional Overview

Backup Wizard

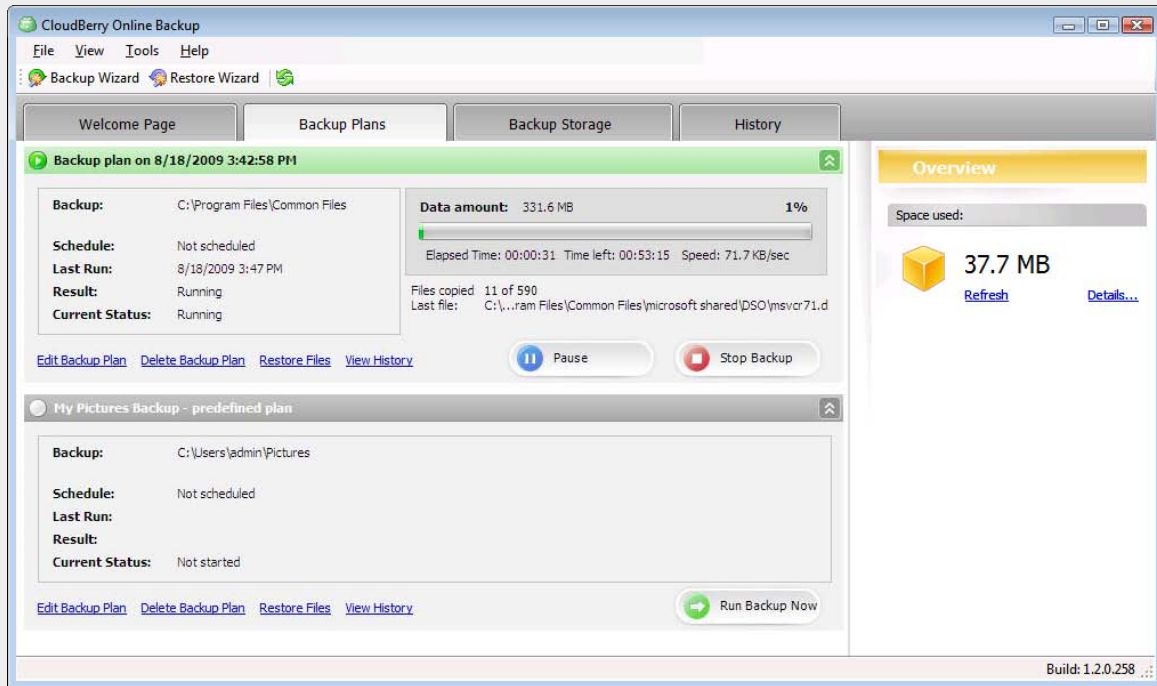

Backup Wizard is designed to help you start using the product and create **backup plans**. While running the wizard you will specify files and folders to backup, compression and encryption settings, retention period and backup schedule.

On the first pass of the Wizard you will also have to specify your [Amazon S3](#) account access /security keys and a bucket where you want backup files to be stored. If you don't have a bucket the product will create it for you.

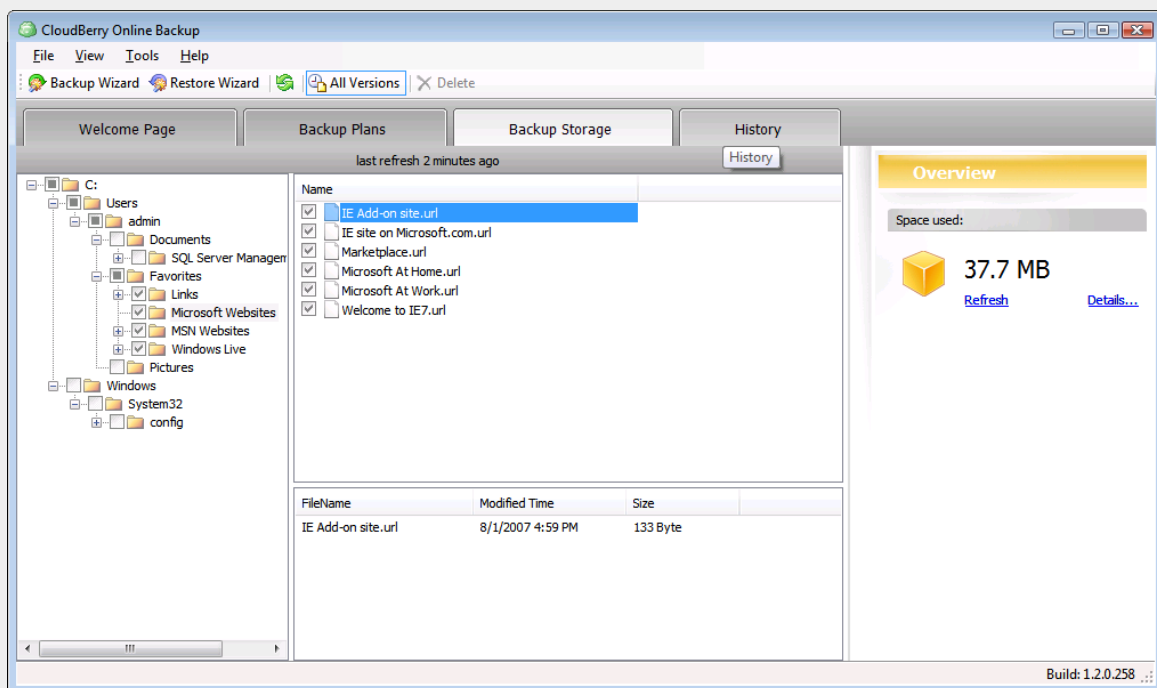

Backup Plans

On the backup plan screens you can get an overview of your backup plans as well as monitor the progress of currently running backup plan, pause and stop it. The **storage capacity indicator** always shows you how much space is currently consumed by your backup. From this screen you may run restore for a certain plan just click “Restore Files” that will guide you to the Restore Wizard.

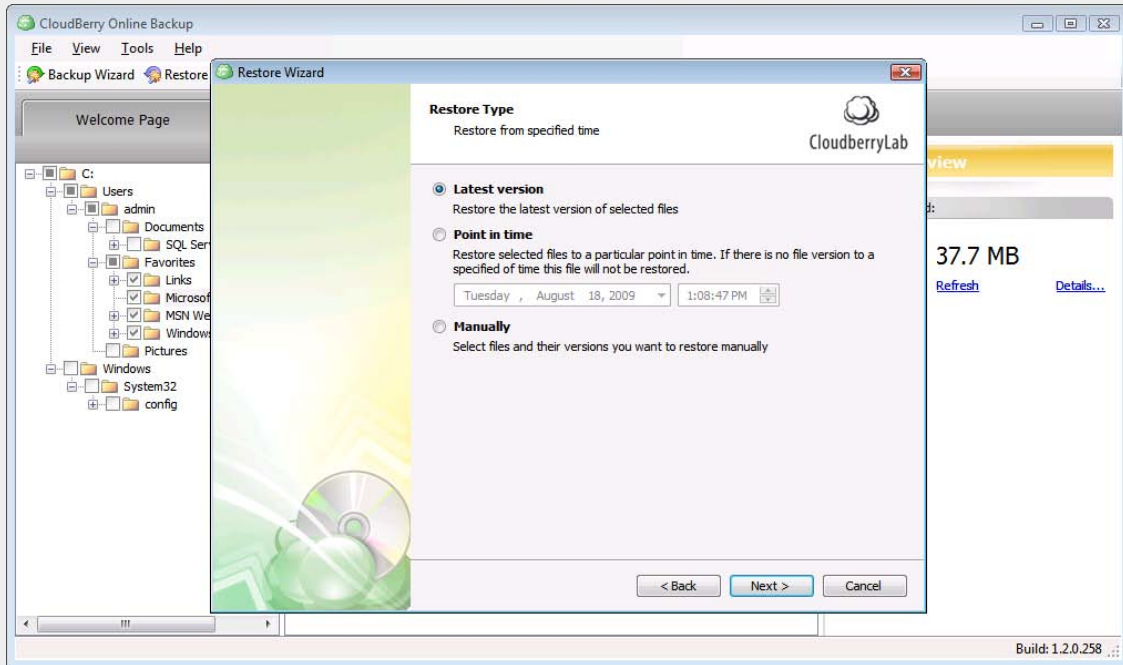

Storage Browser

Storage Browser screen is designed to help you browse your backup storage. You can locate files and its versions there. You can also restore individual or multiple files right from this screen

Restore Wizard

Restore Wizard helps you quickly and easily restore individual files or the whole backup sets as specified in backup plan.

Windows Home Server Plug-in

You can protect the files on your **Windows Home Server** by copying them to Amazon S3. CloudBerry Online Backup seamlessly integrates with WHS Console and make the whole process simple and reliable.
